Sector Reports

Sector Description
South Africa holds the world’s largest reserves of gold (35%), platinum group metals (55.7%), manganese ore (80%) chrome ore (68.3%) titanium metals (21%). It also produces a large share of the world’s diamonds and mineral deposits. Lucrative opportunities exist for downstream processing and value adding of iron, carbon steel, stainless steel, aluminium, platinum group metals and gold. Beneficiation of minerals before export is a major growth area. The Department of Minerals and Energy has embarked on a small-scale mining programme aimed at encouraging and facilitating the development of economically viable small-scale mining and mineral-based industries, in line with the government's desire that small miners gain access to mineral rights suited to small mining activity. Relationships between individual mining companies and the controlling mining houses are being reevaluated. Mergers, restructuring and unbundlings have created much optimism for the industry in recent years, driven by the need to develop black ownership, to expand abroad and by a languishing gold price.
